

ABSTRACT OF THE DISCLOSURE

[0067] The present invention may be regarded as a method for a server computer to provide emergency information to a user computer connected to a system of networked computers. The server computer on the system of networked computers receives a request for an action from the user computer over the system of networked computers. The server computer interrupts the request for the action by sending emergency information to be displayed on the user computer to the user computer over the system of networked computers.
